An overview of farm-to-fork safety in the preharvest realm Foodborne outbreaks continue to take lives and harm economies, making controlling the entry of pathogens into the food supply a priority. Preharvest factors have been the cause of numerous outbreaks, including *Listeria* in melons, *Salmonella* associated with tomatoes, and Shiga toxin-producing *E. coli* in beef products, yet most traditional control measures and regulations occur at the postharvest stage. *Preharvest Food Safety* covers a broad swath of knowledge surrounding topics of safety at the preharvest and harvest stages, focusing on problems for specific food sources and food pathogens, as well as new tools and potential solutions.

Led by editors Siddhartha Thakur and Kalmia Kniel, a team of expert authors provides insights into critical themes surrounding preharvest food safety, including

- Challenges specific to meat, seafood, dairy, egg, produce, grain, and nut production
